

Map for Project 2:

The following map is at a scale of **1:6400**, which means that one of any unit on the map is equivalent to 6400 of the same unit at the location depicted in the map. In other words, one inch on the map is 6400 inches on location, and one centimeter on the map is 6400 centimeters on location. Use your ruler to determine the distances requested below. Assume the scale of 1:6400 is exact (but do NOT assume your ruler will be exact, so round accordingly). It should not matter whether you choose to take your measurements in inches or centimeters, as long as you calculate your unit conversions correctly.
